

Onyx - SiO₂

Hardness: 6.7 - 7. Cleavage: None observed. Tolerates sonication. Dyed material is often discolored by prolonged treatment in acid, alkali or bleach.

Onyx may refer to a quartz-like material or a carbonate-rich/calcite material. Test the sample with a drop of concentrated HCl. If no reaction occurs treat as described here. If effervescence occurs treat as calcite. Some samples are a mixture of these materials and should be treated as the more delicate species (calcite). See Mindat reference (below) for more discussion.
